GUIDE NAME : Dr. Sateesh Kumar

ABSTRACT

- A web-based freelance marketplace that connects clients and freelancers.
- Clients can post projects with requirements, budget, and deadlines.
- Freelancers can browse projects and submit proposals.
- An escrow payment system securely holds the client's payment.
- Payment is released to the freelancer only after the client approves the work.
- Includes project tracking, ratings, reviews, notifications, and transaction history.
- Helps reduce payment fraud, disputes, and trust issues.
- Provides a secure, transparent, and reliable platform for freelance transactions.

PROBLEM STATEMENT

- In freelancing, clients and freelancers often face trust and payment-related issues.
- Clients may hesitate to pay before receiving the completed work, while freelancers may worry about not getting paid after delivering the project.
- This can lead to payment delays, fraud, misunderstandings, and disputes between both parties.
- Existing platforms may not provide a simple and transparent payment process for every transaction.
- Therefore, there is a need for a secure freelance platform with an escrow mechanism that holds the payment safely until the agreed work is completed and approved.
- Our proposed system aims to provide trust, transparency, secure payments, and smooth project management for both clients and freelancers.

EXISTING SYSTEM	PROPOSED SYSTEM
Clients and freelancers may use multiple platforms for communication and work management.	A single platform for managing projects, users and payments.
Both parties may have concerns about trusting each other.	Escrow mechanism provides greater trust between both parties.
Payment may be made directly or in advance, creating risks.	Payment is securely held in escrow until work is approved.
Freelancer may complete the work without certainty of receiving payment.	Payment is reserved before the freelancer starts the work.
Client may pay but receive incomplete or unsatisfactory work.	Payment is released only after client approval.
Project requirements may be shared through different communication channels.	Clients can post projects with budget, requirements, and deadlines.
Proposal management may be less organized.	Freelancers can submit and manage proposals through the platform.

PROPOSED SYSTEM ARCHITECTURE

TOOLS USED

- HTML – Web page structure
- CSS – Styling and responsive design
- JavaScript – Frontend functionality
- React.js – User interface development
- Java – Backend programming
- Spring Boot – Backend framework and REST APIs
- MySQL – Database management
- Git & GitHub – Version control and collaboration
- VS Code / IntelliJ IDEA – Development
- Postman – API testing
- Figma – UI/UX design

THANK YOU
